Presentation Review: Energy Analysis and Optimization for Resilient Scalable Linear Systems

Positives
I thought it was really cool to read and see a presentation about a paper written by one of our own Clemson students. I thought that the paper was one par with most others that we have read this semester, and this presentation was a good representation of it. The presenter helped me understand the general idea behind forward recovery, which I was still confused about after reading the paper. He was able to answer any questions that were asked of him.

Improvements
I think the presenter could have spoken more clearly and a bit louder. There were a few times where it was really difficult to hear what he was saying. There are still a lot of details about the paper (algorithm specifics, advanced concepts) that I am still unclear about. I understand there is not enough time in these presentations to cover every little thing though.
